

IASE 2020 Roundtable Conference

“New Skills in the Changing World of Statistics Education”

Overview of the IASE Roundtable Virtual Conference, Worldwide July 2020: New Skills in the Changing World of Statistics Education

Preface

The 2020 IASE Roundtable Conference, organised by the International Association for Statistical Education (IASE), was to be held in Nanjing, China. Mid March 2020 due to COVID-19 the decision was made to continue with the roundtable but in a virtual format. With some very swift thinking and action the roundtable moved to a virtual worldwide conference.

From July 6 to 12, 2020, 53 people from 23 different countries met virtually across 19 time zones for an invitational Roundtable conference on the theme: “New Skills in the Changing World of Statistics Education”. The virtual conference included an opening and closing session, a keynote address, and nine discussion sessions. An unexpected benefit of holding a virtual roundtable was that IASE members who would not have been able to attend in person were able to participate in the discussions, providing thoughtful contributions from a range of perspectives. In the discussion sessions, 19 papers and two posters were presented. In addition to the paper and poster presenters and the keynote speaker, there were five discussants, five chairs and 26 virtual attendees from the IASE family (note some people filled dual roles).

The opening and closing sessions were held at 11:00-12:00 GMT to allow as many of the roundtable attendees as possible (across 19 time zones) to attend. Chris Wild as the keynote speaker presented at 11pm his local time in New Zealand. The five topic groups met at various times to best meet the presenters in the topic group. The timings included: 7:00-8:00 GMT, 8:00-9:00 GMT, 10:30-11:30 GMT, 14:00-15:00 GMT, 15:00-16:00 GMT, 22:00-23:00 GMT. We acknowledge the commitment of participants, discussants, and chairs to the success of the virtual zoom discussions.

Today is a critical time for statistics with new developments in digital and data technologies and the rise of big data. These changes require not only competency in statistics and statistical literacy but also with new and innovative ways of interacting with data. Both technical and soft skills (i.e., coding, modeling, visualization, communication, collaboration, creativity, etc.) are necessary to handle the challenges of using an enormous amount of information and to provide insights for improving service delivery, policy making, quality of life and so on. The theme of the Roundtable 2020 “*New Skills in the Changing World of Statistics Education*” arose from the needs of today’s information rich society. This changing world of statistics education affects potential curriculum issues and opportunities at school

and tertiary levels.

Building on the previous IASE Roundtables, the 2020 roundtable conference focused on innovations in statistics education for a wider influence in society. Given the rapid developments in the ways of interacting with data enabled by digital technologies, this roundtable conference aimed to discuss development of foundations for statistical literacy from early school years in moving towards big data and “new” skills in relation to data science and analytics, the role of different types of digital tools, and curricular issues in statistics education. The roundtable conference intended to inspire collaborative efforts with various related disciplines and to build bridges between statisticians, statistics educators, software designers, data scientists and data providers.

Roundtable conference themes

In the constantly changing world of statistics, due to emerging data sources available and rapidly advancing technologies over the past decade, new ways of interacting with data require (1) developing an understanding of big data/open data with strong foundations for statistical literacy and the ability to make good judgments and decisions with the efficient use of data analysis tools (known as data acumen), (2) improving skills to use technology and digital tools efficiently, (3) making curriculum at school and tertiary levels relevant to the needs of today’s information rich society, and (4) building effective collaboration among related disciplines, i.e. statistics, mathematics, data science, computer science, etc., and application areas, i.e. science, government, industry, education and so on. This conference addressed emerging opportunities and challenges in relation to these four areas that are detailed next.

1 Big data/open data, data acumen and statistical literacy

With recent advances in computing and communication technologies, data can be found (and collected) nearly everywhere from various sources, including sensors and transaction systems, very large and messy data. In solving big data problems, data management and data cleaning become essentially important steps before starting the data exploration and can pose new challenges in data analysis. Furthermore, the use of digital tools (see 2.2) is inevitable to cope with big data challenges. Open data refer to datasets related to health, crime, migration, or economy, which are freely available to everyone, from sources such as government agencies, national statistical offices and independent foundations. In a time of “fake news” citizens can use these datasets or web applications to inform themselves on specific topics. However, the exploration of open data also requires new skills, like downloading the data files, importing files into digital tools or interpreting the data, which are often given in aggregated form. Since many variables are typically involved in the exploration process, multivariate thinking is another relatively new skill required to explore complex datasets in an efficient and adequate way. Within this context, in order to prepare students for tackling big data problems in the future, we need to understand how to develop precursors that would allow students to use their statistical and data science skills in solving such problems. Getting useful information from big data or open data requires an understanding of key statistical concepts and ideas, and competency in statistical literacy. State-of-the-art statistics education

research can offer new insights for the fundamental understandings of statistics and statistical literacy that are essential in helping students develop the knowledge and skills needed in encountering and making sense of big data.

2 Technology and digital tools

For the exploration of big data and open data (see 2.1), the use of digital tools is essential to handle and manage complex datasets. Digital tools can help to collect, clean, and explore big data and open data. However, using digital tools for these purposes require further skills, and different digital tools can serve different purposes. It is a matter of the complexity of the digital tool versus the potential of the digital tool. On one end of the spectrum, educational software tools like TinkerPlots can be effectively used to introduce learners to explorations of data and data modeling through simulations, and support the learning process for basic understandings of statistical concepts and ideas but might be limited in some other features for formal statistical procedures such as regression methods. On the other end, professional statistical software tools (e.g. R or Python) offer a wide range of data exploration features for large and messy data but also require efforts in learning programming commands. RMarkdown or Jupyter Notebooks provide a learning environment to structure the data analysis and data exploration workflows. In between there are tools like CODAP as online data analysis platform with the possibility to implement hierarchies in data structures or Excel as typical spreadsheet software, which requires commands for the data analysis procedure or even handheld graphing utilities. The decision on the use of the digital tool(s) is strongly dependent to its purpose, however all these tools require new skills for learners, teachers, statisticians, and statistics educators.

3 Curriculum

New data and data visualization tools available now offer possibilities as well as challenges for curricular development in statistics education from primary school to the tertiary level. In the world of big data, including open data, the increased size and complexity of the data along with a large number of variables and a variety of data types require specific knowledge (in mathematics, statistics and computing), data and computing skills, and dispositions. Around the world, some universities have degree programs specialized in data science/data analytics, and some countries have begun to consider the integration of data science across the curriculum at school level or designing a data science curriculum for secondary schools. The common emphasis in these efforts involves solving real and meaningful problems, developing an understanding of core statistical ideas in context, multivariate thinking, statistical modeling, computing, data-driven decision making, multidisciplinary and so on. School curriculum has an important role in providing the groundwork for statistical thinking and statistical literacy needed for these in working with new sorts of data. However, the existing school curricula in many countries are not aligned with these essential ideas and approaches for dealing with the complexity of big data nor the use of advancing technology. The content of these curricula needs to be reviewed and revised to reflect the changes in the knowledge, skills and dispositions required in data science. Yet, attention needs to be given to issues related to the accessibility of complex datasets and linking the use of such data with content taught within the school curriculum. Furthermore, in the era of big data, the opportunities for incorporating the use of secondary data in the curriculum both at the

secondary school and tertiary levels can provide meaningful context for exploring foundational statistical ideas, such as the role of sampling theory in data collected digitally.

4 Collaboration

Extracting knowledge and insights from increasingly large, complex datasets for use in various application areas requires a multidisciplinary approach. While statistics is inherently multidisciplinary, data science brings statistics, mathematics, and computer science together to solve big data problems in applied fields. Hence collaboration among researchers and experts from these disciplines and domain application areas becomes essential to effectively solve the problems. Collaboration and communication are also one of the 21st century learning skills in preparing students to succeed in the information age. Both the statistics and data science fields can generate new educational approaches to engage students at different ages in practices across different disciplines. Although this multidisciplinary approach provides new opportunities to build connections among mathematics, statistics, science, computing and other data-rich subjects at school level, integration of data science in existing school curriculum might bring some challenges in relation to aligning different content areas and training of teachers.

Topics and Preliminary Research Questions

The 2020 IASE Roundtable Conference focused on the following areas:

1 The use of real and meaningful data in teaching and learning statistics

- How can real and meaningful data be used to promote student interest and engagement in statistics?
- How to access real and meaningful data to promote student interest and engagement in statistics?

2 The emerging role of multivariate thinking in inferential reasoning

- What are the important ideas and skills in relation to multivariate thinking in statistical inference?
- How can the use of technology promote multivariate thinking with large datasets?
- How does the use of multivariate data nurture students to become data detectives?
- What are innovative tasks or sequence of instructional activities that can be used to support students' multivariate thinking?

3 The influence of data science on the school curriculum and introductory statistics courses

- How do we prepare people to cope with the complexity of big data?
- What knowledge, skills and dispositions are required in data science to develop data acumen?
- What is the role of statistics, computation and domain knowledge in data science curriculum?
- What are the ways to engage students in studying data science?

- What are the challenges for integration of data science in the school curriculum/undergraduate statistics courses or designing a data science curriculum at school level/undergraduate statistics?
- What are the ways to support teachers/instructors implementing aspects of data science in schools/at the tertiary level?

4 Increasing power of technology and its use for doing statistics and for enhancing learning and understanding of key statistical concepts

- How can new technology tools enrich students' statistical practice, such as gathering organizing, structuring, modeling and interpreting data and making inferences?
- How can digital tools be implemented in classrooms? In which way can the orchestration take place?
- Which digital tools are adequate for different purposes? How can the balance of learning the tool and using the tool be realized?
- How does technology support pedagogical approaches that are needed to enable students to develop data acumen and deepen foundational background in statistics?

5 The changing nature of data visualization and implications for the curriculum

- How can different data visualizations help to develop students' conceptual understanding of key statistical ideas?
- How does student-generated data visualizations support the development of students' understanding of key statistical ideas?

6 Collaboration with other disciplines to enhance students' statistical understanding

- What can statistics and statistics education learn from other disciplines?
- What can other disciplines (e.g. computer science, computer science education, domain application areas, etc.) contribute to statistics education?
- What are the emerging educational approaches for engaging students at different ages in multidisciplinary of statistics and data science?
- What are the opportunities and challenges in integrating data science in existing school curriculum including mathematics and statistics, science, computing, and other data-rich subjects?

Acknowledgements

The 2020 IASE Roundtable initial plans and program for Nanjing, China were planned by an International Program Committee (IPC) and the Local Organising Committee (LOC). The logistics of the virtual conference were managed by the IPC. The contributions of the IPC and the LOC are greatly appreciated.

International Program Committee (IPC)

- Sibel Kazak (Turkey), Chair of the International Program Committee
- Pip Arnold (New Zealand), Editor of Proceedings
- Joachim Engel (Germany), President, IASE
- Gail Burrill (United States), Past-President, IASE

- Gaofeng Da (China), Co-Chair of the Local Organizing Committee
- Dequn Zhou (China), Co-Chair of the Local Organizing Committee
- Daniel Frischemeier (Germany)
- Nicholas Horton (United States)
- Tae Rim Lee (South Korea)
- Genelyn Sarte (Philippines)
- John Shanks (New Zealand), Information Manager

Intended Local Organising Committee (LOC) before change to virtual conference

- Dequn Zhou (Chair), Nanjing University of Aeronautics and Astronautics, China
- Gaofeng Da (Chair), Nanjing University of Aeronautics and Astronautics, China
- Jian Chen, Nanjing University of Aeronautics and Astronautics, China
- Mei Han, Nanjing University of Aeronautics and Astronautics, China
- Linhan Ouyang, Nanjing University of Aeronautics and Astronautics, China
- Hecheng Wu, Nanjing University of Aeronautics and Astronautics, China
- Xufeng Zhao, Nanjing University of Aeronautics and Astronautics, China

IASE roundtable conferences only happen because of the commitment of many people from around the world who are prepared to give time and effort freely. Thank you to the paper and poster authors for their flexibility to adapt to the change in the format and structure of the conference and also the work they did in the preparation of their initial papers to present at the conference and final papers for the conference proceedings. An appreciation of all the referees who gave generously of their time and expertise to support the improvement of the quality of the papers. A special big thank you to the discussants and chairs of the virtual sessions. It is a more challenging environment to make people feel welcomed and to promote discussion in virtual sessions, and you welcomed people to the space and invited them to contribute.

Taking the conference virtual happened because people were prepared to make it so. Thank you to:

- Sibel Kazak, Joachim Engel, Gail Burrill, and Pip Arnold for pulling together the online program
- Dilcu Barnes, Gail Burrill, Adam Molner, Rolf Biehler, Stephanie Budgett and Joachim Engel for organising synchronous and asynchronous discussions, hosting the zoom sessions, presenting reflections and coordinating across many time zones
- Sibel Kazak, Daniel Frischemeier, Nicholas Horton, Genelyn Sarte and Pip Arnold for chairing the zoom sessions
- John Shanks for updating the website with the information needed for the adjusted program
- Chris Wild for being the very late-night keynote speaker
- The paper and poster presenters for preparing a short video clip in advance the conference for participants to preview.

You are invited to read the conference proceedings here:
