Healthcare workers feel difficulty in statistical analysis of data. Approximately 70% of healthcare workers were working statistically in the routine work, of which about 30% were doing analyzes other than simple counting. In addition, only one responded "I am able to analyze". Therefore, we held a monthly seminar about data analysis method necessary for medical staff in the business. The purposes of the participants were "Analysis method using Excel", "Visualization of data, such as table and graph creation", etc. We emphasize analytical methods that can be completed only with Excel without using statistical software, and teach how to create comprehensible materials simply by devising from everyday work. Satisfaction from participants is high, and we will report the details from the seminar.
