

Think Organic!

What's up Doc? My carrot is organic! The aim of our project is to find out how students in our school feel about organic food, and whether they buy or grow organic food.

We surveyed 152 students aged between 12- 18, using Google Docs.

When asked whether they would buy organic food, the answers were as following...

As you can see the results were nearly 50/50!

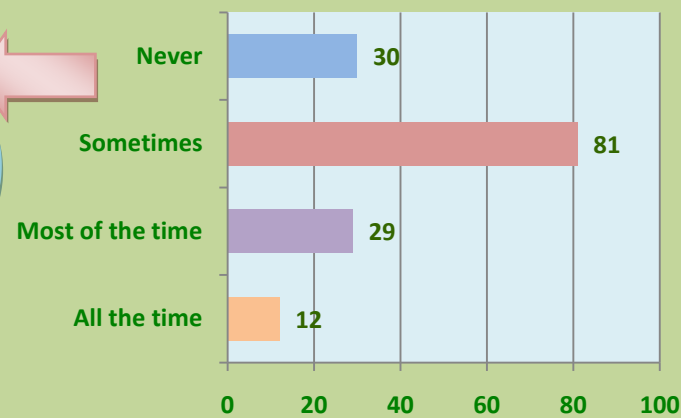

Yes No

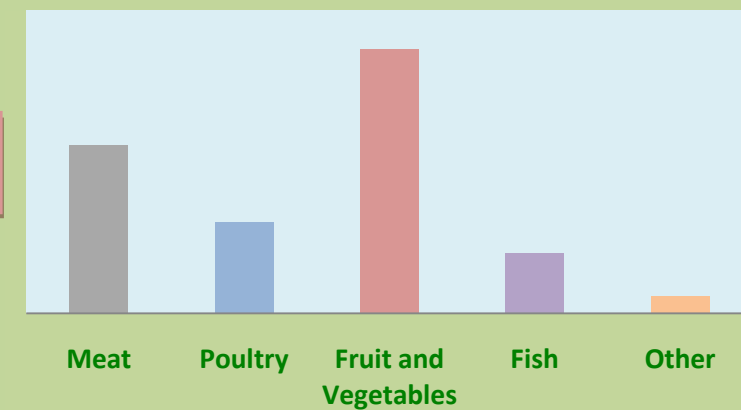

Then...

We asked what type of Organic Food they would buy...

The majority of people surveyed only buy organic food sometimes and very few buy it all the time.

But how often do people actually buy organic food....?

Fruit and vegetables were the most popular choice!

We wanted to find out if people actually grew their own food in the garden...

The majority of people don't appear to grow their own food at home, but a significant 41% do!

Yes No

Of those who did grow food at home...

Organic Non Organic

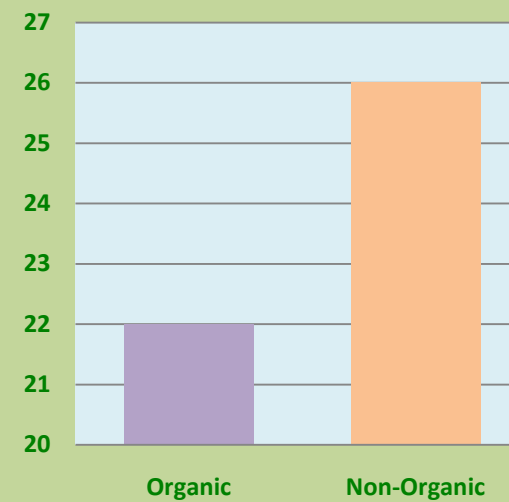

28% of people lived on a farm, we found out the most common types...

But do the farmers in our school farm organically?

The answer is no, the majority of the farmers said their produce is non-organic...

As you can see...

This data tells us that:

- Students would consider buying organic food.
- Whether food's organic or not doesn't make that much of an impact on a student's choices, and they only buy organic sometimes.
- The most popular types of organic food bought are fruit and vegetables.
- Quite a large number of people grow organic food at home in the garden.

When asked their opinion on organic food, a most students noted that organic food was expensive.

In conclusion...

Over 70% of students said that they considered organic food to be healthier.
